This sequence represents the Cys-rich peptide sequence of legume plant derived insecticidal peptide PAID corresponding to that of an entomotoxic pea protein. The invention relates to a novel insecticidal peptide PT (AAYS5990) isolated from pea plants which has homology to the PAID peptide and to the leginsuline from soybeans (AAYS5991). The insecticidal peptide and to the leginsuline from soybeans (AAYS5991). The insecticidal peptides preferably have the amino acid sequence:

XICysX2CysX4CysX5CysX6CysX7 where XI = 2-10 amino acids; XS = 2-4 amino acids; XS = 7-15 amino acids; XA = 3-10 amino acids; XS = 2-4 amino peptide can be used to protect cereal products or plants from attack by cereal grain pests, e.g. Sitophilus oryzae, Ephestia kuehniellea or Acyrthosiphon pisum, either directly or by genetically modifying plants (especially cereal plants) to express the peptide in their tissues or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                      This sequence represents the Cys-rich peptide sequence of legume plant derived insecticidal peptide leginsuline corresponding to that of an entomotoxic pea protein. The invention relates to a novel insecticidal peptide protein. The invention relates to a novel insecticidal peptide professor isolated from pea plants which has homology to the PAID peptide (AAY55991) and to the leginsuline from soybeans. The insecticidal peptides preferably have the amino acid sequence: XICysXZCySXCySXCySXCySXXCySXX, where X = 2-10 amino acids; X = 2-5 amino acids; X = 4-10 amino acids; X = 2-4 amino acids; X = 7-15 amino acids; X = 2-10 amino acids; X = 2-4 amino peptides can be used to protect cereal products or plants from attack by cereal grain peets, e.g. Sitophilus orzae, Ephestia kuehniellea or Acyrthosiphon pisum, either directly or by genetically modifying plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (especially cereal plants) to express the peptide in their tissues or

The invention provides a method for obtaining a plant which produces at least one seed having a modified phenotype. The method involves transforming a host plant cell with a DNA construct which consists of perably linked components in the direction of transcription, a promoter region from a Brassica plant gene, a DNA sequence of interest other than the native conding sequence, and a transcription termination region. The method is useful for obtaining plants having modified phenotype or for altering the phenotype of a plant seed or tissue. The DNA constructs are used in manipulating plant cells to provide for regulated transcription, cused in manipulating plant cells to provide for regulated transcription, cuch as light inducible transcription, in a plant tissue or plant part of interest at particular stages of plant growth or in response to external control. These constructs are also used for modulation of expression of endogenous products as well as production of exogenous products in the seed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a DNA construct comprising, as operably linked components in the direction of transcription, a promoter region obtainable from a gene, e.g. a napin gene, an EAA9 gene or an acyl carrier protein (ACP) gene, a DNA sequence of interest other than the native coding sequence of the gene and a transcription termination region, where the components are functional in a plant cell and where the DNA construct is flanked by T.DNA. Also included are a plant cell having an altered phenotype as a result of expression of a DNA construct, a plant comprising a DNA construct, a seed obtained from the comprising cells comprising a DNA construct, a seed obtained from the comprising a plant having an modified phenotype or modifying the construct of a plant to impart a desired characteristic to seed as clistuct from other plant tissue, altering the phenotype of plant seed tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue as distinct from other plant tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue and selection of plant or regulating tissue and/or developmental specific transcription and expression in plants. The plants construct, enhanced response to light and dehydration resistance and construct, and pasts. The seed specific promoters are from the plant and pasts. The seed specific promoter as from the transcription and expression in plants are firem and the fruit specific promoter as from the transcription and expression in plants are from the plant and the fruit specific promoter as from the transcription and expression in plants of the Napin, ACP and EA9 genes and the fruit specific promoter as from the transcription and expression and setting and pasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tomato 2A11 gene. The present sequence is a reactive site from a protein similar to the tomato 2A11 protein (thought to be a protease inhibitor).
                                                                                                                                                                                                                                                                                                    New DNA construct comprising a promoter region, a DNA sequence of interest and a transcription termination region, useful for producing transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention provides a method for obtaining a plant which produces at least one seed having a modified phenotype. The method involves transforming a host plant cell with a DNA construct which consists of operably linked components in the direction of transcription, a promoter region from a Brassica plant gene, a DNA sequence of interest other than the native coding sequence, and a transcription termination region. The method is useful for obtaining plants having modified phenotype or for altering the phenotype of a plant seed or tissue. The DNA constructs are such as light inducible transcription, in a plant tissue or plant part of interest at particular stages of plant growth or in response to external control. These constructs are also used for modulation of expression of endogenous products as well as production of exogenous products in the seed. Sequences ABBSS94147 represent fragments of storage proteins used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining a plant that produces a seed with a modified phenotype or altering a seed phenotype, comprises transforming a plant cell with a DNA construct consisting of operably linked components in the direction of

```

New DNA construct comprising a promoter region, a DNA sequence of interest and a transcription termination region, useful for producing transgenic plants.

The invention that the direction of transcription, a promoter region obtainable from a gene, e.g. a napin gene, an EA9 gene or an acyl carrier protein (ACP) gene, an DAA sequence of interest other than the native coding sequence of the gene and a renativity to the chain the native the components are functional in a plant cell and where the DNA construct is flanked by T.DNA. Also included are a plant cell and where the DNA construct is flanked by T.DNA. Also included are a plant cell and where the DNA construct a phenotype as a result of expression of a DNA construct, a seed obtained from the phenotype of plant, bottaining a plant having a modified phenotype or modifying the comprising a plant that plant a desired characteristic to seed as genotype of a plant to impart a desired characteristic to seed as genotype of a plant tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue as distinct from other plant tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue as distinct from other plant tissue and selectively expressing a heterologous DNA sequence of interest in seed tissue as distinct from other plant tissue and selectively expressing a heterologous DNA sequence of a plant to impart a desired characteristic. The construct is useful in modification of plant or regulating tissue and/or construct is useful in modification of plant or regulating tissue and/or produced have increased capability of protein storage, improved nutrient source, enhanced response to light and dehydration resistance. and the Napin, ACP and EA9 genes and the fruit specific promoters are from the Napin, ACP and EA9 genes and the fruit specific promoter is from the tomato 2A11 gene and the fund to be a protein similar to the tomato 2A11 protein (thought to be a protease inhibitor). The invention relates to a DNA construct comprising, as operably linked

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the human nuclear transcription factor-2, designated NFX2. The NFX2 gene has a cDNA sequence of 3613 base pairs (bp) containing an open reading frame sequence of 3075 bp from position 62 to 3136, encoding a sequence of 1024 amino acids and having a Genbank number of AF332009. The present invention also describes: (1) utiliating the NFX2 gene to prepare a fusion protein; (2) utilising the protein to immunise an animal and to prepare monoclonal and polyclonal antibodies; and (3) utilising the gene in preparing testicular specific function gene expressing chips. The expressed protein may be useful in gene therapy for treating related disease. The NFX2 gene has been located to human
                                                                                                                                                                                                                                                                           Human; nuclear transcription factor 2; NFX2; chromosome 9; gene therapy.

Human NF-X1 (AAR94957) is a new DNA-binding protein which regulates expression of major histocompatibility complex (MHC) class II molecules. The sequence was deduced from a cDNA clone (AAT18813) isolated from Raji cells. NF-X1 is a cysteine-rich polypeptide which interacts specifically with the conserved X1 box regulatory element (AAT18812) found in the proximal promoters of class II MHC genes. It contains a cysteine-rich domain (see also AAR94955-56) required for both sequence-specific binding and effector function. Overexpression of NF-X1 specifically represses transcription of the HiA-DRA gene. NF-X1 can be obtd. by expression in transformed host cells and is useful in the treatment of allergic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transcription factor, NF-X1 and DNA encoding it - used in regulation of MHC class II expression and in treatment of allergic disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic,
                                                                           Huntington's disease; osteoarthitis;
Leber's hereditary optic neuropathy; LHON;
mitochondrial encephalopathy lactic acidosis and stroke; MELAS;
myoclonic epilepsy ragged red fibre syndrome; MERRF; cancer;
neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic;
osteopathic; ophthalmological; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                     Human heat mitochondrial protein as a therapeutic target SeqID1481.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Apoptase; human; mouse; rat; L100; apoptosis; anticonvulsant; vasotropic; nootropic; neuroprotective; antiparkinsonian; ischaemia; cerebroprotective; epilepsy; Alzheimer's disease; Parkinson's disease; Huntington's disease; amyotrophic lateral sclerosis; multiple sclerosis;
                                                                                                    New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of apoptase enzymes, designated L100, from the human, mouse and rat. The
                                                                                                                                                                                         The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antifinammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of bracterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment regimes, and identification of compounds useful for the treatment of endometrial.
                                                                                                                                                                                     7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosing breast cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant tissue.
protein can be used in the treatment of apoptosis related diseases, including epilepsy, ischaemia, Alzheimer's, Parkinson's and Huntington's diseases, amyotrophic lateral sclerosis, multiple sclerosis, central nervous system injury and stroke. The present sequence is the murine apoptase into protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of the beta 2 chain of human laminin-15, a novel member of the laminin family that is produced in the retina. The cretina produces 2 novel laminin trimers: laminin-14 (alpha 4, beta 2, gamma 3) and laminin-15 (alpha 5, beta 2, gamma 3). These are expressed within the inter-photoreceptor matrix and in the outer plexiform layer, and may serve to stabilise retinal synapses. The invention provides cand may serve to stabilise retinal synapses. The invention provides laminin-15 preparations and cells comprising a nucleic acid encoding the laminin alpha 5, beta 2 and gamma 3 chains, and which are capable of producing laminin-15. The laminin-15 preparation is used in claimed methods of: increasing retina immunophotoreceptor matrix stability, increasing retina immunophotoreceptor compounds, especially and treating a disorder associated with retinal dependancy increasing retina adhesion; treating a disorder associated with retinal dependancy of synapses of the and retinal detachment; increasing the stability of synapses of the contral nervous system or peripheral nervous system, stability of synapses of the implant, e.g. a catheter, artificial joint, retinal implant, timed conting with the laminin-15 preparation; and increasing photosensitivity by implanting a tip coated with the laminin-15 preparation into an eye. The laminin may be recombinant, and the 3 chains co-expressed in the same

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, or the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABOG7826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, encoding a polypeptide which is believed to be cytostatic, antibacterial and virucidal. The composition and methods are useful for diagnosting, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Beaurang PA, Behrens D;

                                                      28-AUG-2003; 2003WO-US026780
                                                                                                                                                                                                                                                                                                                  29-AUG-2002;
17-SEP-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7-SEP-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-SEP-2002;
                     29-APR-2004
     New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Behrens D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Linnemann T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 27.9%; Score 60.5; DB 8; Length 915; Best Local Similarity 37.5%; Pred. New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antibated antinflammatory, immunosuppressive, antibaterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence as a number of the second sequence is available on WIPOWEB and is not in the specification.

J. Biochem. 270:1269-1276(2003).
-1- FUNCTION: Alb binds to basic 7S globulin (BG) and stimulates its
phosphorylation activity. Involved in the signal transduction
system to regulate the growth and differentiation as a hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STRUCTURE BY NMR OF 20-56, MUTAGENESIS OF ARG-35; VAL-48 AND PHE-50,

J. Biochem. 270:1269-1276(2003).
-I- FUNCTION: Alb binds to basic 75 globulin (BG) and stimulates its phosphorylation activity (By similarity).
-I- PTM: The C-terminal glycine may be removed from Alb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phaseolus aureus (Mung bean) (Vigna radiata).

Birte; TISSUB=Cotyledon;
Domonov C., Blis N., Welham T.;
"Genetic loci controlling albumin synthesis in Pisum.";
Submitted (MAR-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PAID binds to basic 75 globulin (BG) and stimulates its
phosphorylation activity. Involved in the signal transduction
system to regulate the growth and differentiation as a hormone
peptide. Toxic to various insects through binding to a high
affinity binding site in the insect the Similarity.
-!- TISSUE SPECIFICITY: Major comopnent of both the cotyledons and
                                                                                                                                                                                                                                                                                                 Gaps

Higgins Extructure, protein in pea seeds.";
a sulfur-rich protein in pea seeds.";
J. Biol. Chem. 261:11124-11130(1986).
-1-FUNCTION: Palb binds to basic 78 globulin (BG) and stimulates its
phosphorylation activity. Involved in the signal transduction
system to regulate the growth and differentiation as a hormone
peptide. Toxic to various insects through binding to a high
affinity binding site in the insect gut (By similarity).

Hissue Specific Try: Major comopnent of both the cotyledons and
embryonic axes of mature seeds.

-1- DEVELOPMENTAL STAGE: Increasing expression during seed development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          [Contains: Albumin 1 D chain

Plant Sci. 167:705-714(2004).
-!-FUNCTION: PAID binds to basic 7S globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide. Toxic to various insects through binding to a high affinity binding site in the insect gut (By similarity).
-!- PTM: The C-terminal glycine may be removed from PAID.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

C -! FUNCTION: PALD binds to basic 78 globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide. Toxic to various insects through binding to a high affinity binding site in the insect gut (By similarity).
C -! TISSUE SPECIFICITY: Major comopnent of both the cotyledons and embryonic axes of mature seeds.

                                                                                                                                                                                                                                                                                              Gressent F., Rahioui I., Rahbe Y.;

"Characterization of a high-affinity binding site for the pea albumin "Characterization of a high-affinity binding site for the pea albumin be entomotoxin in the weevil Sitophilus";

Bur. J. Biochem. 270:2429-2435(2003).

-I. FUNCTION: PALD binds to basic 7S globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide (By similarity). Toxic to various insects through binding to a high affinity binding site in the insect gut.

-I. PTM: The C-terminal glycine may be removed from PAlb.

-I. PTM: PAlb displays a cysteine-knot (knottin) fold.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Higgins T.J., Chandler P.M., Randall P.J., Spencer D., Beach L.R., Blagrove R.J., Kortt A.A., Inglis A.S.; "Gene structure, protein structure, and regulation of the synthesis of a sulfur-rich protein in pea seeds."; J. "Gene structure, protein structure, and regulation of the synthesis of a sulfur-rich protein in pea seeds.";
J. Biol. Chem. 261:11124-11130(1986).
-- FUNCTION: PAID binds to basic 78 globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide. Toxic to various insects through binding to a high affinity binding site in the insect gut (By similarity).
-- TISSUE SPECIFICITY: Major component of both the cotyledons and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           embryonic axes of mature seeds.
-!- DEVELOPMENTAL STAGE: Increasing expression during seed development followed by a rapid degradation during the first days of seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -I- PTM: The C-terminal glycine may be removed from PAlb.
-I- MISCELLANEOUS: The protein sequenced in Ref.2 was probably a mixture of the products of genes C and D, PAlb being of C origin while PAla is of D origin.

                                                                                                                                                                 Flant Mol. Biol. 34:613-627(1997).
-!- FUNCTION: Alb binds to basic 78 globulin (BG) and stimulates its phosphorylation activity (By similarity).
-!- PTM: Three disulfide bonds are probably present.
-!- PTM: The C-terminal glycine may be removed from Alb.

A Note: 49-11e was also found

C; Comment: The vertebrate metallothioneins contain two metal-binding domains. Clusters o

C; Comment: Cysteine clusters can also chelate univalent metal ions. As many as 18 differ

C; Superfamily: metallothionein

C; Superfamily: metallothionein

C; Keywords: accetylated amino end; chelation; metal binding; metal-thiolate cluster

F; 1-29/Domain: beta. < MH2>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               F;30-61/Domain: alpha <ALP>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 11
S62935
Nypothetical protein YNL023c - yeast (Saccharomyces cerevisiae)
Nypothetical protein YNL023c - yeast (Saccharomyces cerevisiae)
NyAlternate names: hypothetical protein N2812
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Accession: S62935; S62945
R;Andre, B.; Iraqui Houssaini, I.; Urrestarazu, L.A.; Vissers, S.
submitted to the Protein Sequence Database, April 1996
